Phase 4 (Exit Question): (also answered in the LAB_HANDOUT.md file)

After looking at the sriroute_tools.py file, it is the model itself that keeps the OMR bike from being assigned to REQ-902. While the Pydantic validation that we implemented today only checks the types of the objects being passed into them: it only ensures that both of its inputs are strings. The first is checking if it makes sense to assign a perishable item to the OMR bike but the second one just validates if the types of the inputs is correct (checking if the logic is sound versus validation of the type).
